How to: Setup for interpretation of online events

Learn how you can use LiveVoice for interpretation of online events.

(Basics)   (Live Translation)   (Admin)

With LiveVoice you can provide live translation - either with human interpreters or AI - for basically any online event or video conference.
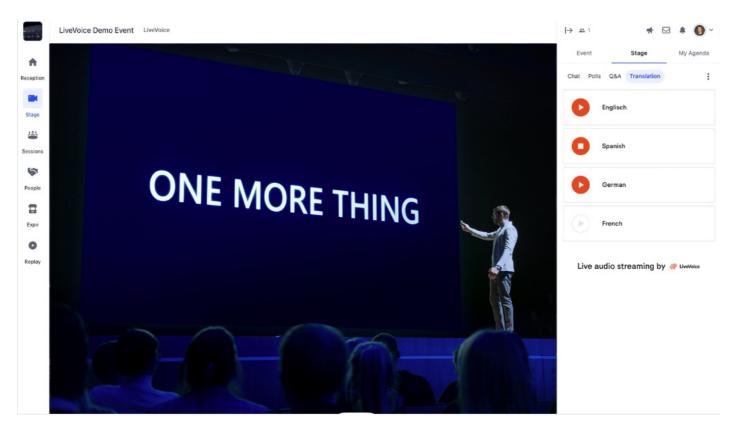

There are two options. For both options the **interpreters** can watch the same feed as the audience. Either they work with two windows, or you ingest the video and audio to LiveVoice as explained here.

Option 1: Using an online events platform with LiveVoice integration

If you are using an online events platform that already has LiveVoice integration, like Cvent or RingCentral, the online audience can listen to the translation directly next to the live stream.

You can provide the same experience also on your own website, using our iFrame integration.

Check out the available integrations into online event platforms.

Option 2: Using LiveVoice alongside any video stream

If you choose not to use an integration, it is also possible to provide LiveVoice alongside any online event platform or video stream. Users can simply open the LiveVoice translation on a separate browser window on their computer.
