LiveVoice

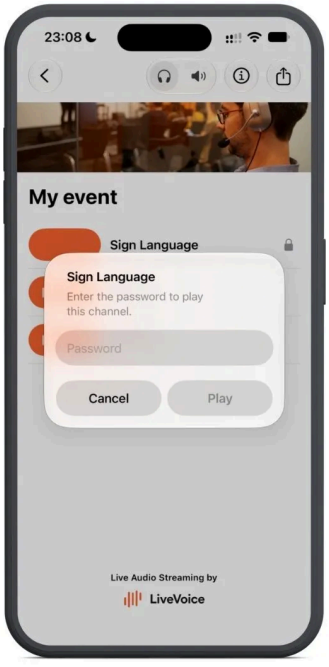

Channel password

Decide who can open each channel by giving it its own password for participants.

Available with: PLUS

You can set a separate password for each channel of your event. Participants then need to enter this password before they can open that channel, whether they listen to audio, watch video or read captions. You can use a channel password on its own or in addition to the participants password for the whole event.

Channel passwords only apply to participants. To control who can stream on your channels, use the speaker password.

Example: Sign language video channel

Some events offer a video channel with sign language interpretation. Video needs much more internet bandwidth than audio. If many people open the video channel who don't need sign language, it might use up a lot of the venue's internet connection.

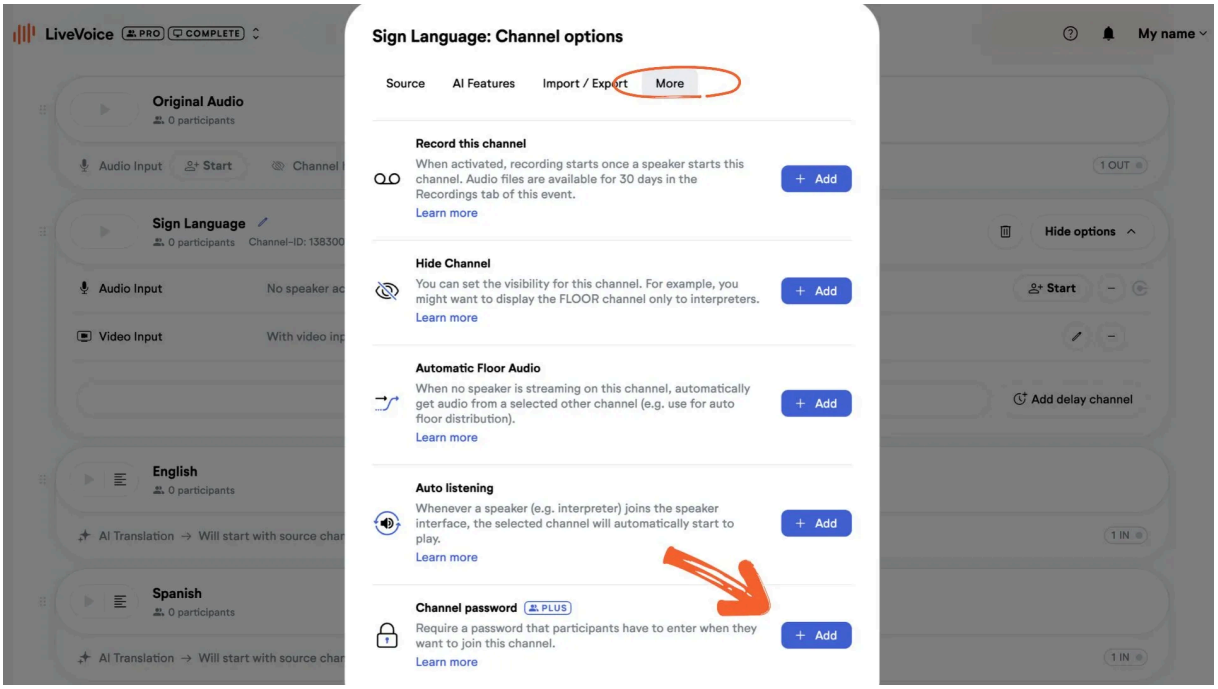

With a channel password, you share access to the video channel only with the participants who use sign language. Everyone else joins the event and the other channels as usual.

Setup

Step 1: Click "Show options" on the channel you want to limit access to.

Step 2: Click "Add feature."

Step 3: Open the "More" tab, turn on the channel password and set a password.

Now, when someone opens this channel, they are asked to enter the channel password.

Using both an event and a channel password

If you set both, participants first enter the event password when they join your event. They then see all the channels of the event. They're only asked for the channel password when they open a channel that has one.

infoPLUS feature

This is a PLUS feture. If you'd like to use it contact our support team.
